

KS Virtual Remote Control Center Web interface for simple management of virtual environment

The easy-to-use tool KS Virtual Remote Control Center (VRCC) developed by Kancelarske stroje is based on application server IBM Websphere and the API of VMware VirtualCenter Server and ESX hosts. It allows for a simple management of virtual machines using standard web interface with no need to install any specific client applications (for example VMware Virtual Infrastructure Client) and with no need to setup access to VirtualCenter server using its web services. Thereby increasing security of the whole solution and protecting the solution against unauthorized interventions of common users in its entirety. The other important aspect is that use of KS VRCC decrease significantly utilization of the virtualization layer itself and furthermore of VirtualCenter management server as well. Last but not least, the VRCC solution enables administrators to place the whole virtualization solution, including VirtualCenter management server, into the separate private network with external management permitted only through VRCC acting as a proxy.

Picture nr. 1 – Basic interface of KS VRCC (localization: Czech)

KS Virtual Remote Control Center enables common users to perform basic operation with virtual servers they "own" (they have privileges to operate), like Start, Stop, Pause, Rename, Take a snapshot etc. Besides the VRCC allows advanced features, like definition of a new virtual machine within assigned resource pool, deployment of a new server from a template including automatic assignment of new IP address, cloning of servers, etc.
