Service-Oriented Architect and Application Developer skills roadmap

Role
The service-oriented architect is expected to articulate business and technical values of service-oriented architecture (SOA), help determine return on investment, be familiar with new industry standards, design patterns, and be able to craft service-oriented architecture solutions using existing assets and new components. Such an architect should also understand and be able to contribute to governance issues related to service development, deployment and management within the organization.

Assumptions
It is assumed that the individual following this roadmap has architect skills and needs to learn about service-oriented architecture, design concepts and SOA implementation technologies.

1 Prerequisite skills for Architect

Objectives
After completing this step, students should be able to:
- Describe the organization of use-case, analysis, design, and deployment models.
- Generate an analysis model from a requirements model and elaborate on the model.
- Generate a design model from an analysis model and elaborate on the model.
- Incorporate existing code and reusable assets in the development of a new application.
- Add elements used for testing and verification to the design.
- Model a service in Rational Software Architect using the UML Profile for Software Services.
- Create a User Experience model and generate JSF elements from that model.
- Incorporate the IBM Patterns for e-business in the design of a system
- Define and customize RequisitePro project structure and components
- Create and build a project
- Create, import, and revise requirements, attributes, and requirement documents
- Define hierarchies of requirements
- Trace requirements to one another
- Manage changing requirements through views, queries, metrics, and revision notification

2 SOA fundamentals

Objectives
After completing this step, students should be able to:
- Explain the business and technical value of adopting SOA
- Describe SOA and explain how it relates to contemporary software architectural styles
- Explain the principles and characteristics of services within SOA, and identify various service types
- Explain Information Services, and how and when to apply it
- Describe service-oriented integration (SOI) and explain how it differs from contemporary integration approaches
- Identify methodologies for service-oriented analysis and design
- Describe programming models and standards that support the realization of SOA and SOI
- Describe Web services, and explain how they support the realization of SOA solutions
- Describe IBM’s SOA Foundation, and identify IBM offerings that support IBM’s SOA life cycle
- Explain the need for SOA governance
- Explain IBM’s SOA governance offerings for establishing SOA governance within an organization
- Explain IBM’s SOA scenarios and describe how these support adoption of SOA within an organization

Introduction to the Value and Governance Model of Service-Oriented Architecture

VW003
Web-based (4 hours)

or

Designing SOA Solutions with Project, Technical, and Operational Governance

VW004
Web-based (6 hours)

Technologies and Standards for SOA Project Implementation

VW005
Web-based (6 hours)

Do you only need implementation skills?

Yes

Proceed to:

5 SOA application development

No

7 Skills for SOA governance

3 Basic Web services skills

**Objectives**
After completing this step, students should be able to:

- Articulate the role of Web services in SOA
- Describe the purpose of WSDL
- Read, describe and create WSDL document
- Explain the role of XML in Web services
- Explain the purpose of SOAP
- Describe the transports commonly used in Web services, such as HTTP and Java Messaging Service (JMS)
- Summarize the role of an Enterprise Service Bus (ESB) and how it relates to Web services
- Describe issues in Web services interoperability
- Explain the role of a registry in SOA

</tbody>
</table>

4 SOA design, modeling and realization skills

**Objectives**
After completing this step, students should be able to:

- Define the functional, data and operational aspects of a service-oriented architecture
- Specify IBM software and Web services technologies to fulfill a service-oriented architecture
- Identify issues that arise when defining service-oriented architectures, by handling a variety of difficulties in the case studies and working with other experienced IT professionals to resolve them
- Apply Service design principles such as the use of explicit interfaces, the use of loose coupling, and the passing of data by value rather than by reference.
- Perform service identification and modeling
- Categorize services
- Apply SOA design patterns
- Craft SOA adoption roadmap for an organization
- Help define and apply SOA governance

**Certification test**
See certification Web site
For test preparation
**Test 667**
IBM Certified SOA Solution Designer
Architectural Design of SOA Solutions

Yes

No

Do you need more skills in designing services?

**CONTINUED**
on the following page...
SOA application development skills using WebSphere Enterprise Service Bus (WESB), WebSphere Message Broker (WMB), WebSphere Process Server (WPS) and WebSphere Integration Developer (WID)

Objectives
After completing this step depending on the selected path, students should be able to:
- Describe IBM ESB products and capabilities such as WESB, WMB, DataPower, DataStage, WebSphere Information Integrator
- Articulate ESB design patterns and its role in IBM SOA Reference Architecture
- Design ESB Solutions and select appropriate products to use as ESB
- Apply best practices for product integration and federation
- Integrate WebSphere Business Integration adapter with ESB
- Use Web services bindings (SOASP/HTTP and SOAP/JMS) for access to the bus
- Describe the security features and key capabilities of IBM DataPower SOA Appliances
- Create key security services on an IBM DataPower SOA Appliance
- Use dynamic endpoint for routing of messages
- Design and develop mediation solutions
- Implement security in ESB
- Create a business state machine

What is your focus area?
- Service Creation and Reuse
- Business Processes

Are you familiar with SOA fundamentals?
- Yes
- No

### Skills for SOA on systems i and z

**Objectives**
After completing this step, students should be able to:
- Explain how SOA can be extended to Systems i and z
- Describe how the existing assets can participate in an SOA solution in Systems i and z
- Prescribe ways to modernize the application and infrastructure environment using IBM SOA Foundation on Systems i and z

---

**Objectives**
After completing this step, students should be able to:
- Describe the role of a service registry and repository within a service-oriented architecture (SOA)
- Describe the architecture of WebSphere Service Registry and Repository
- Explain how WebSphere Service Registry and Repository supports SOA governance and service life cycle management
- Explain the need for a federated registry/repository strategy within SOA, and describe how WebSphere Service Registry and Repository supports this strategy
- Describe the topology considerations for planning a WebSphere Service Registry and Repository deployment configuration
- Configure security for WebSphere Service Registry and Repository
- Customize the information metamodel in WebSphere Service Registry and Repository to suit the SOA governance model for an organization
- Implement governance policies and service life cycles
- Describe how to integrate WebSphere Service Registry and Repository with IBM WebSphere Enterprise Service Bus (ESB) solutions such as WebSphere Enterprise Service Bus, WebSphere Message Broker, and DataPower to perform dynamic lookup of service metadata and service policies
- Describe the benefits of runtime integration between WebSphere Service Registry and Repository and IBM Tivoli Composite Application Manager for SOA V6.1

---

Which platform do you work with?

**System i**
- Adopting Service-Oriented Architecture on System i
  - SW814
  - Web-based (6 hours)
- Building SOA-based Solutions for IBM System i5 Platform
  - SG24-7284
  - Redbook

**System z**
- The Role of IBM System z In the Design of a Service Oriented Architecture
  - REDP-4190
  - Redbook
- The Value of the IBM System z and z/OS in Service-Oriented Architecture
  - REDP-4152
  - Redbook
- SOA Transition Scenarios for the IBM z/OS Platform
  - SG24-7331
  - Redbook

---

**Skills for SOA governance**

---
Skills for SOA security

Objectives
After completing this step, students should be able to:

- Describe common security architectures and network models
- Describe security standards and technologies
- Apply security to SOA design as a business requirement
- Articulate integrated security management for SOA
- Explain the impact of security requirements on SOA design
- Recommend appropriate products to address security requirements

Can be taken in any order

Understanding SOA Security Design and Implementation
